USER MANAGEMENT AND ROLE-BASED ACCESS CONTROL

AIM

To design and demonstrate a User Management and Role-Based Access Control (RBAC) system that organizes users, assigns roles, defines permissions, and controls access to application resources according to each user's responsibilities.

WORKFLOW

1. Open the application dashboard and review the summary of user-role assignments, permission mappings, user profiles, and role definitions.

2. Create or review role definitions such as Admin, Teacher, Student, Guest, and Support.

3. Configure access levels and associate suitable permissions with roles and resource types.

4. Create user accounts and maintain user profile details.

5. Assign roles to users, recording the assigned date, assigning person, effective date, expiry date, and active status.

6. Review role assignments and permission configuration reports to verify that access settings are correct.

PROCEDURE

Step 1 – Dashboard: Open the dashboard to view the total role assignments, permission mappings, user profiles, role definitions, and language-related charts.

Step 2 – User Role Assignment: Open User Role Assignment. Enter the user, select a role, provide the assigned date and assigned-by details, set effective and expiry dates, choose the active status, and submit.

Step 3 – View Role Assignments: Open All User Role Assignments to review existing assignments and their dates, assigned-by values, roles, and active status.

Step 4 – Role Definitions: Open All Role Definitions to review role names, role codes, descriptions, access levels, creation dates, and system-role status.

Step 5 – Access Levels: View the available access-level categories and the roles associated with them.

Step 6 – Permission Configuration: Review permission names, codes, resource types, action types, descriptions, and whether each permission is enabled.

Step 7 – Resource Types: Review the resource categories used by the system, such as Report, Admission, Profile, and Settings.

APPLICATION SCREENSHOTS

RESULT

The User Management and Role-Based Access Control application was demonstrated successfully. The system provides a structured way to define roles, configure access levels and permissions, manage user profiles, and assign roles with effective and expiry dates. The dashboard and reports help administrators review assignments and permission settings. Therefore, the application supports organized user administration and role-based control of access to system resources.
