PRO-CODE EXTENSION USING ZOHO CATALYST

Case Study Report

1. AIM

To study and demonstrate a Student Admission Creation Extension developed using Zoho Creator with workflow automation and Zoho Catalyst as the proposed pro-code cloud platform. The system organizes admission applications, student profiles, document uploads, academic records, eligibility criteria, and application-status history in a single interface.

2. THEORY

Low-code platforms help build applications through visual components, forms, reports, and workflows. However, complex business rules, integrations, custom validation, advanced processing, and deployment requirements may need pro-code development. Zoho Catalyst provides a cloud development environment for building and deploying custom application logic and services. A hybrid approach can use visual forms for standard data entry while using code and cloud functions for specialized logic, integrations, and automation. The screenshots show the admission application's dashboard, records, entry form, status views, and workflow configuration.

3. PROCEDURE

1. Open the Student Admission Creation application and review the dashboard metrics and charts.

2. Open the admission application list to inspect application codes, student details, programs, academic year, status, document count, and eligibility score.

3. Use the Admission Application form to enter or select student and program details, application date, status, document count, eligibility score, remarks, and portal reference.

4. Review Previous Statuses to understand how application states and related updates are displayed.

5. Open the Workflow section and inspect the configured workflows, including automatic application-code generation and student notification after successful submission.

6. Use the screenshots as evidence of the implemented interface and workflow configuration. For a production pro-code extension, implement custom business rules and integrations through appropriate server-side functions and APIs, then test validation, permissions, and failure handling.

Note: The supplied screenshots document the current application interface and its workflows. They do not independently prove that custom Zoho Catalyst functions have already been deployed.

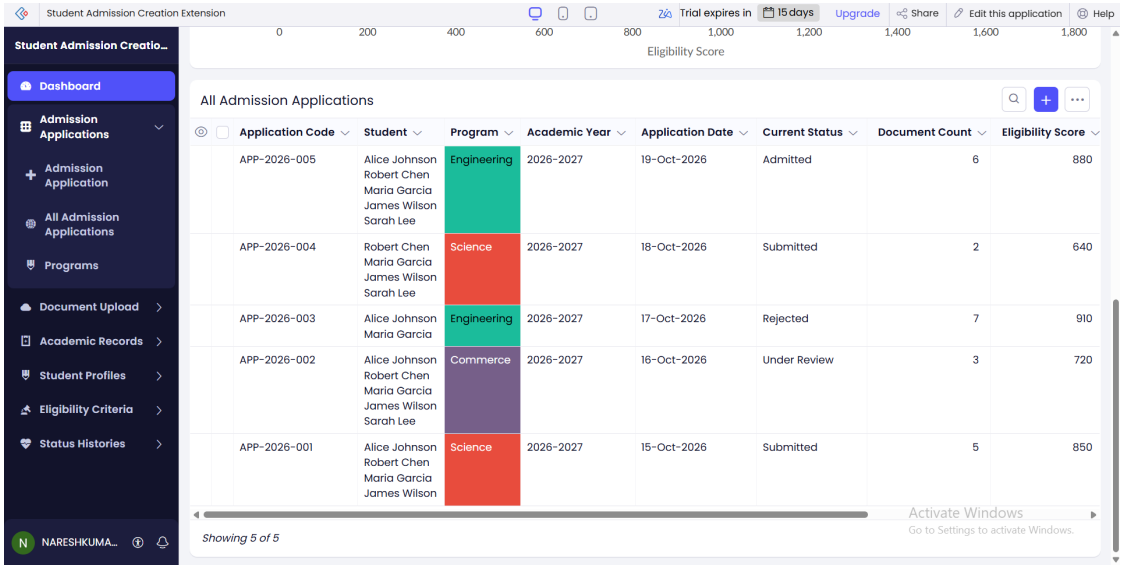

Figure 2. Admission application records showing program, academic year, status, documents, and eligibility score.

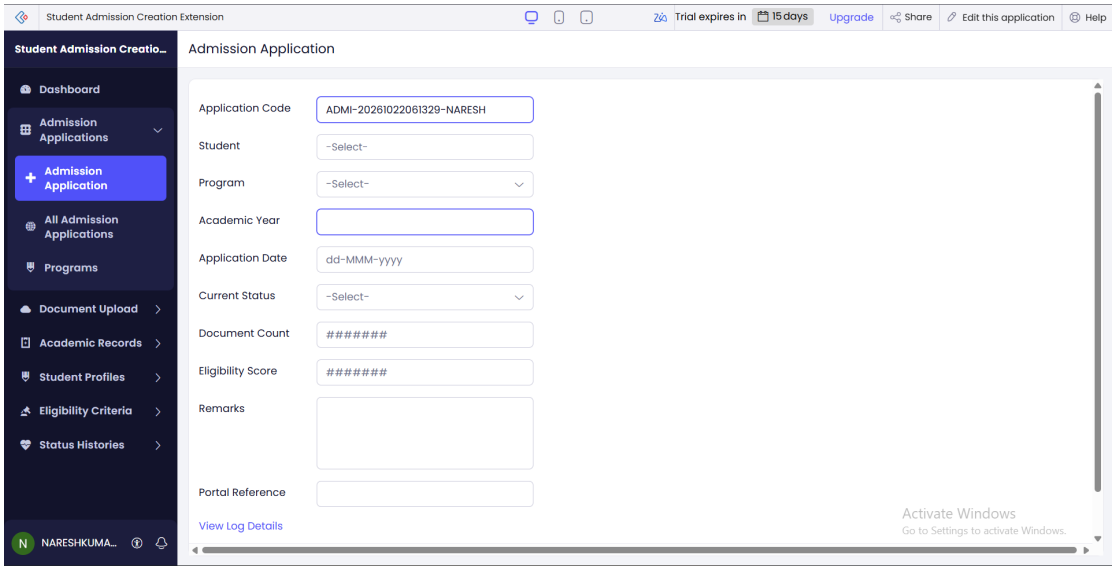

Figure 3. Admission application form for entering application and student details.

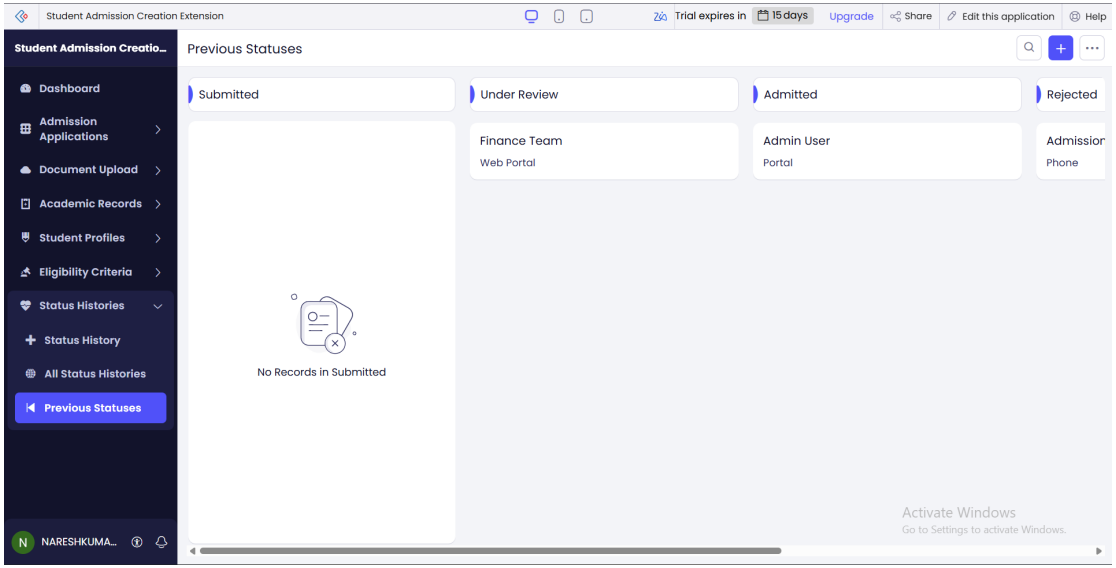

Figure 4. Previous Statuses view for reviewing status history.

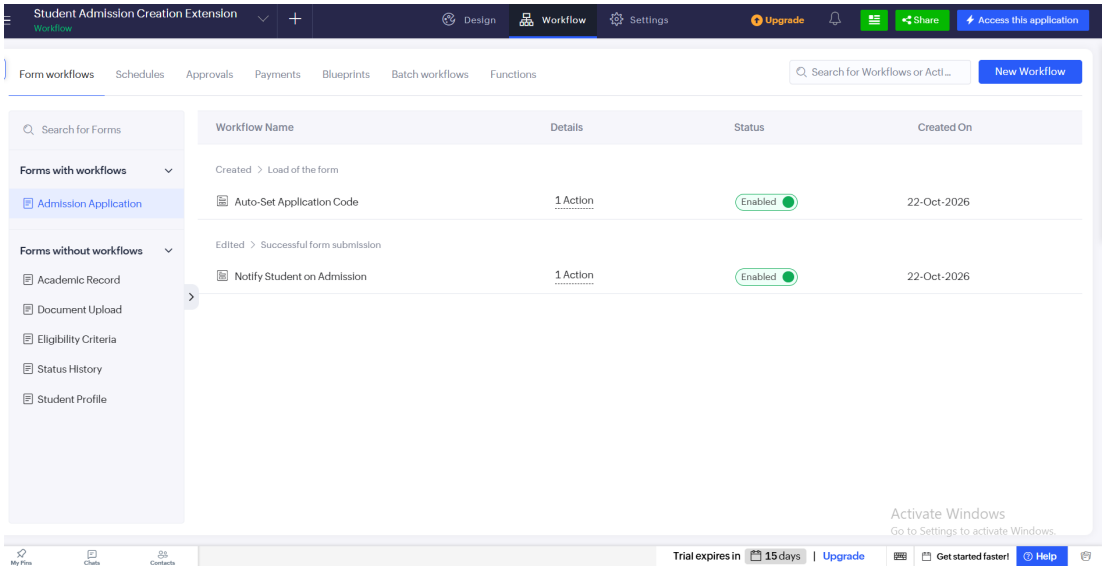

Figure 5. Workflow configuration showing application-code generation and student notification.

4. RESULT

The Student Admission Creation application interface and its main modules were reviewed successfully through the supplied screenshots. The dashboard presents summary metrics and charts; the application list displays admission records and eligibility information; the form supports entry of application details; the Previous Statuses view presents status-related information; and the workflow screen shows automation for generating application codes and notifying students after successful submission. The case study demonstrates how visual application components can be combined with workflow automation, while more advanced requirements can be handled through pro-code services and integrations using Zoho Catalyst.
