1. AIM

To configure and examine a Student Admission Management application in Zoho Creator, organize student academic and guardian information, present key admission information through a dashboard, and apply a validation workflow to improve data accuracy and the reliability of form submissions.

2. OVERVIEW

Zoho Creator is a low-code application development platform used to build forms, reports, dashboards, and workflows. The Student Admission application shown in this practical organizes academic records, streams, parent/guardian details, student profiles, fee payments, document uploads, and class allocations.

Performance optimization in this context focuses on making information easier to review, reducing avoidable data-entry errors, and presenting useful summaries without requiring users to inspect every record manually. The dashboard provides summary metrics and charts, reports present stored data in structured tables, and a GPA validation workflow checks submitted academic information. The screenshots document the visible setup and configuration; they do not by themselves establish measured speed improvements.

3. PROCEDURE

Step 1: Review the dashboard

Open the Student Admission application and review the dashboard. It displays summary cards for total marks, average GPA, total annual income, and total amounts. It also shows stream counts, verification status by file size, annual income by relationship, and quick links for adding records. These summaries help users locate important information quickly.

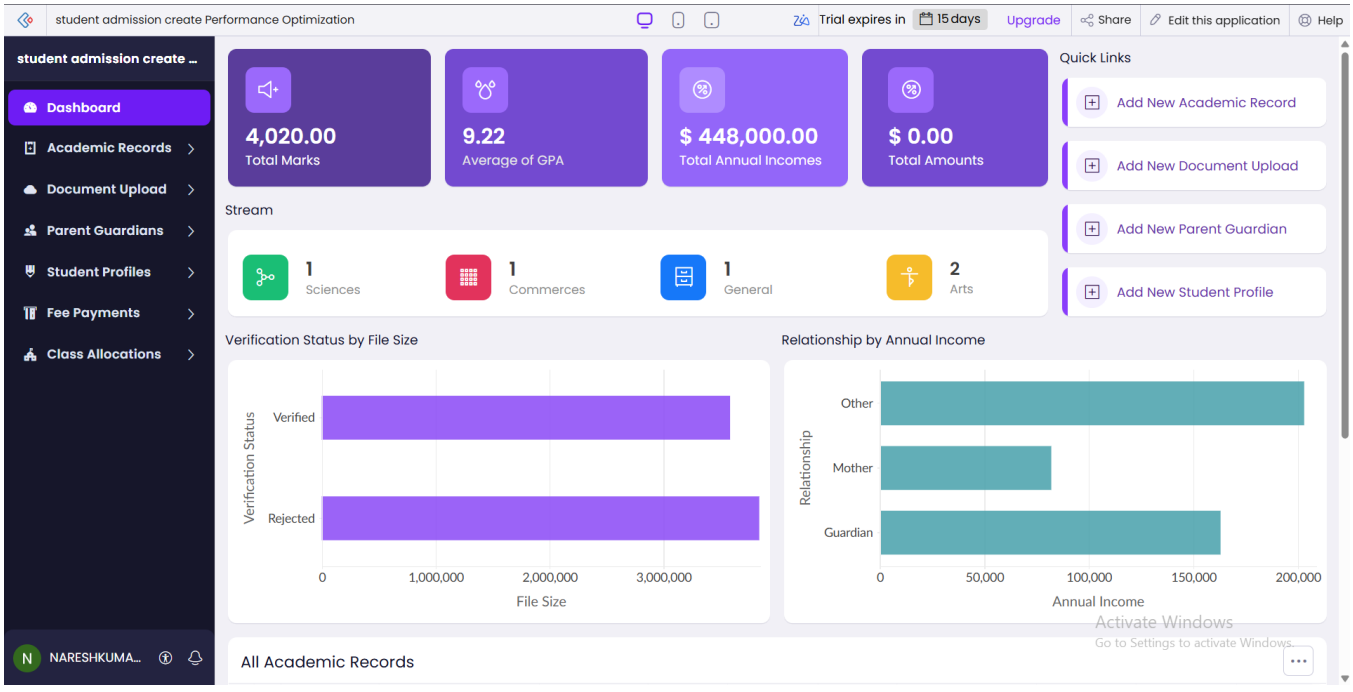

Figure 1. Dashboard showing student admission statistics, stream counts, charts, and quick links.

Step 2: Enter academic information

Select **Academic Records** → **Academic Record** to open the entry form. Fill in the student identifier, previous school, last grade, GPA, stream, board, year of passing, subject names, and total marks. Select the appropriate stream from the dropdown and check the entered values before submitting. Use Reset only when you intend to clear the form.

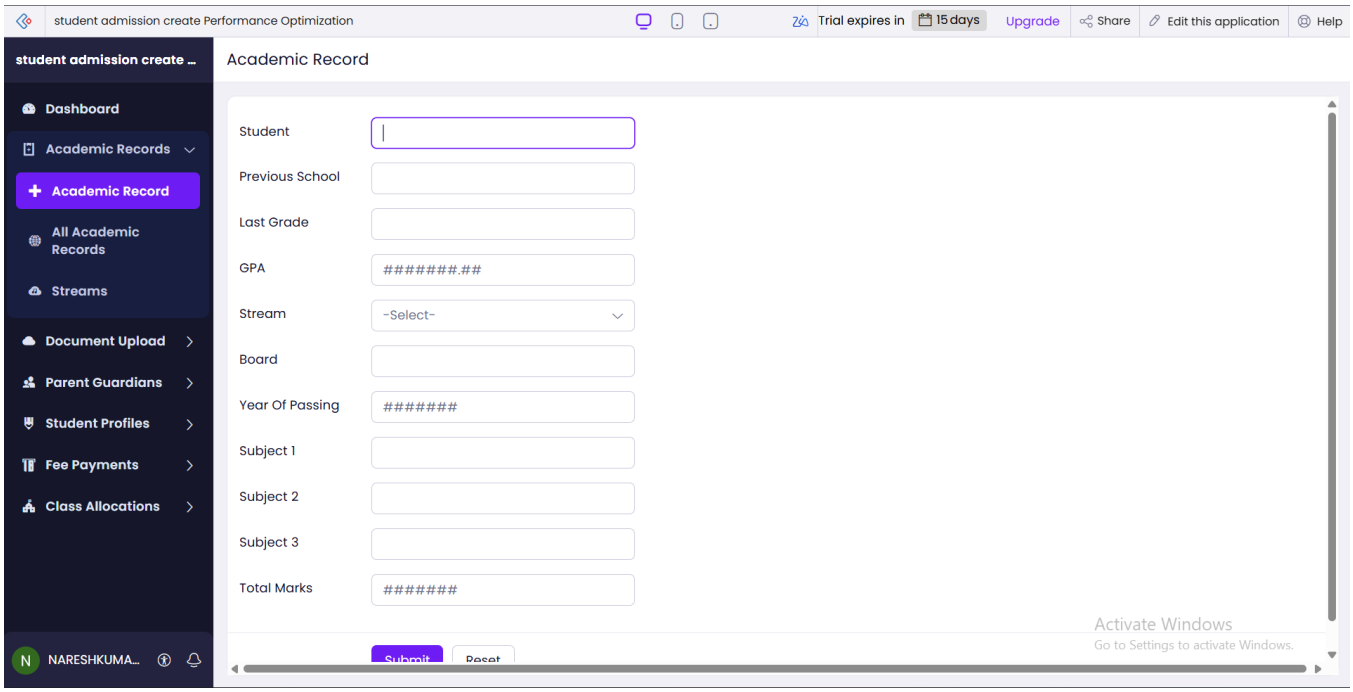

Figure 2. Academic Record form used to enter a student's academic details.

Step 3: Review all academic records

Open **All Academic Records** to review saved entries in a tabular report. The visible columns include student, previous school, last grade, GPA, stream, board, year of passing, and subjects. Use the report to check whether entries are consistent and to identify missing or incorrect values. The screenshot shows five records in the report.

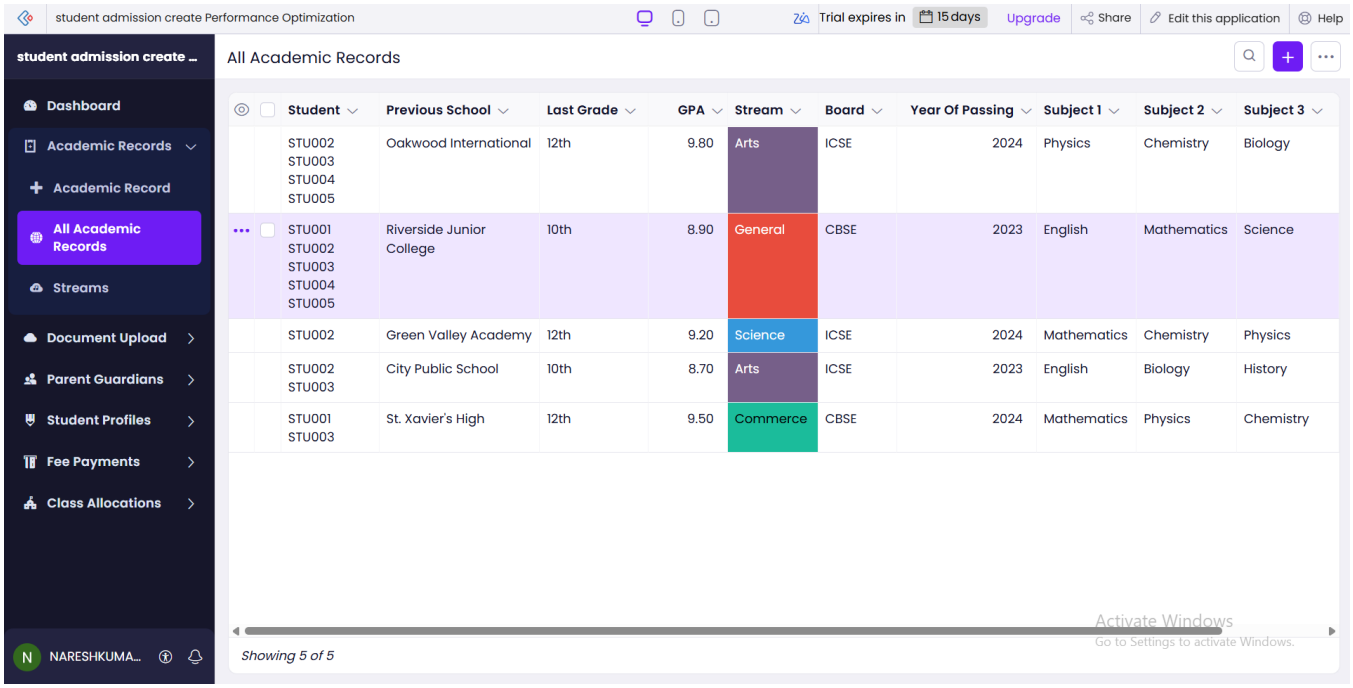

Figure 3. All Academic Records report displaying student academic entries in a tabular view.

Step 4: Organize streams

Open the **Streams** section to view stream categories such as Science, Commerce, General, and Arts. This categorization helps group academic information by study stream and supports clearer reporting. Confirm that each academic record is assigned to the appropriate stream.

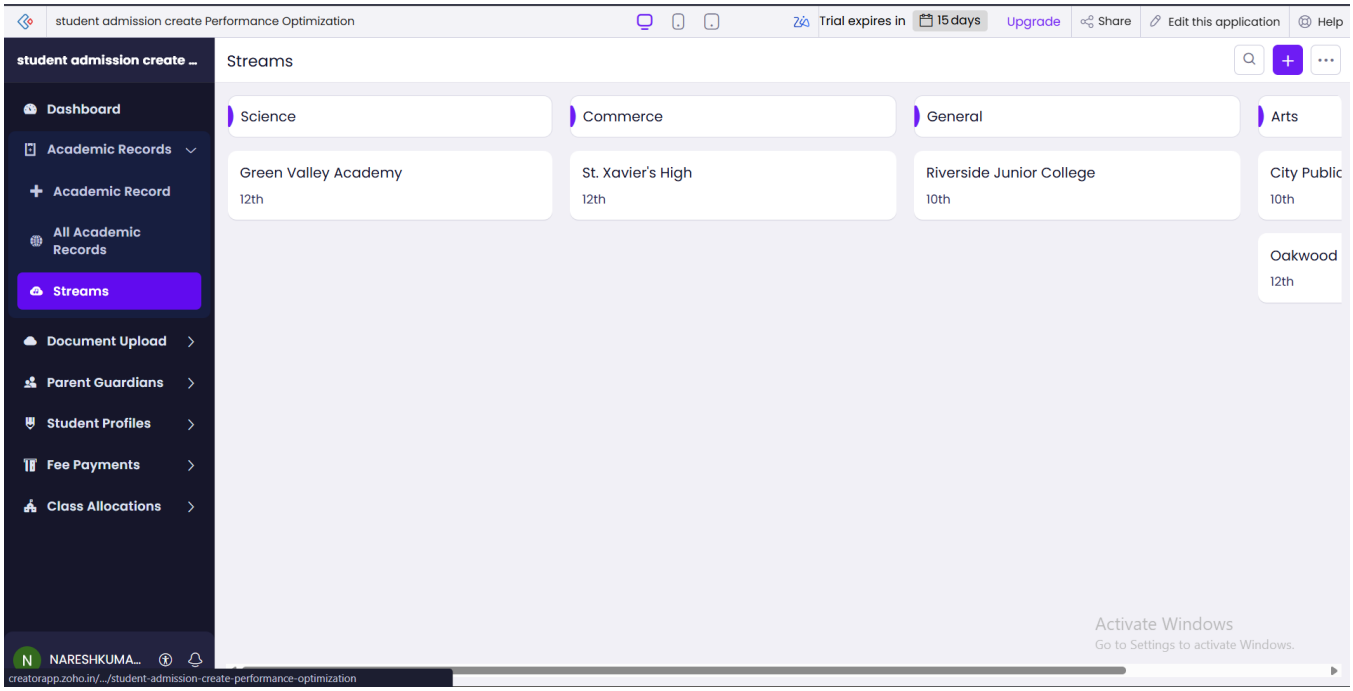

Figure 4. Streams page showing stream categories and related school records.

Step 5: Review parent and guardian information

Open **Parent Guardians** → **All Parent Guardians**. Review the student association, guardian name, relationship, occupation, company, contact number, email address, and annual income fields. Keeping these details in a structured report helps staff find relevant guardian information efficiently. Handle personal contact and financial details only for authorized admission-related purposes.

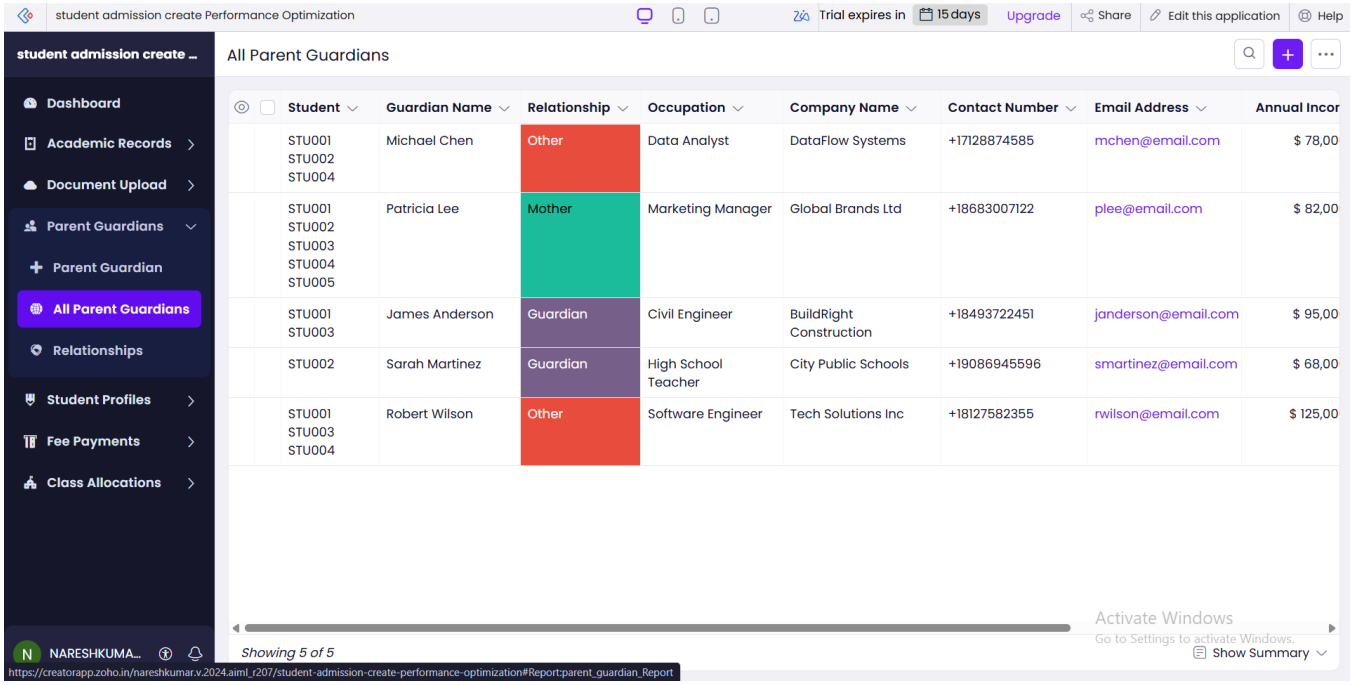

Figure 5. Parent/Guardian report showing relationships and guardian contact and employment details.

Step 6: Configure GPA validation workflow

Open the **Workflow** area and select the Academic Record form. The workflow list shows an enabled workflow named **Validate GPA Before Submission**, with one action. This workflow is intended to validate the GPA before a form submission is accepted. Verify that the validation rule checks the expected GPA range and provides a clear message when the value is invalid. Test both valid and invalid GPA values before using the application in a live setting.

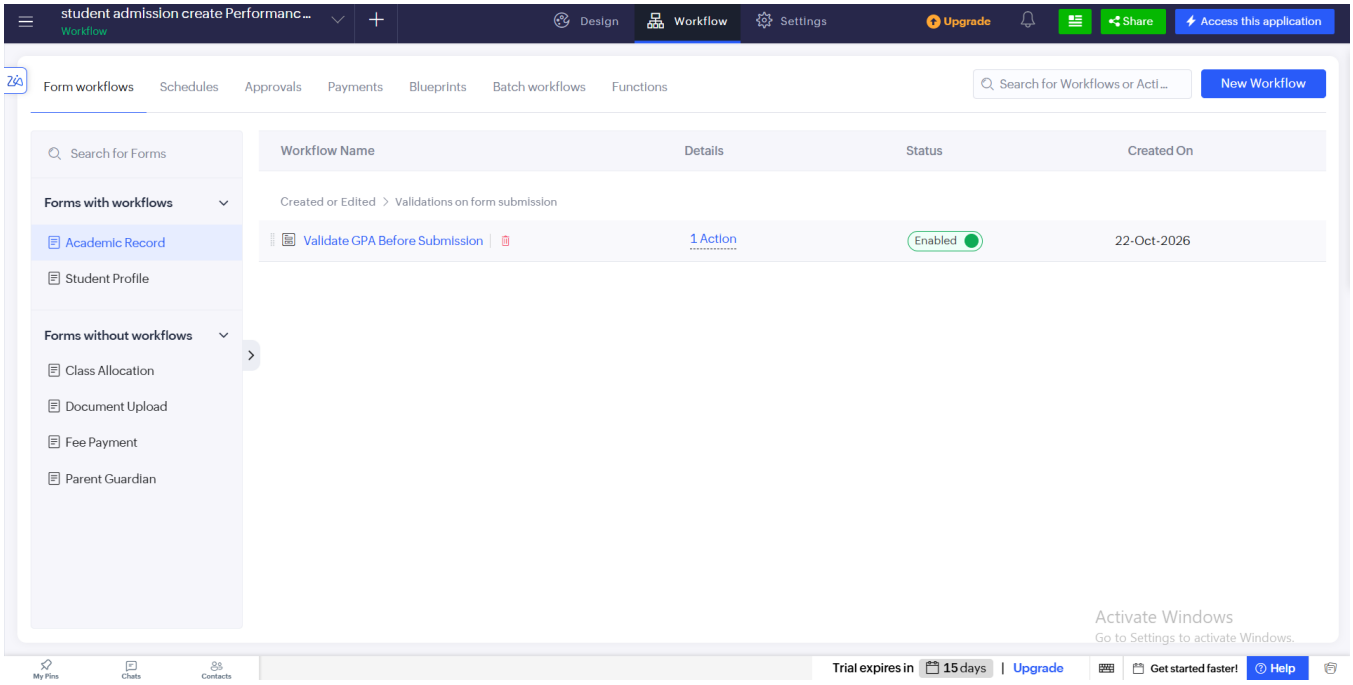

Figure 6. Workflow configuration showing the enabled "Validate GPA Before Submission" workflow.

4. PERFORMANCE OPTIMIZATION PRACTICES

• **Use summaries for quick review:** keep dashboard metrics and charts focused on information staff need regularly.

• **Validate at entry:** check GPA and required fields before saving to reduce correction work later.

• **Keep fields consistent:** use dropdowns for categories such as stream and relationship wherever suitable.

• **Use reports to find issues:** review missing values, inconsistent student identifiers, and incorrect academic details.

• **Test after changes:** confirm that forms, reports, dashboards, and workflows still work correctly after configuration changes.

5. RESULT

The Student Admission application was reviewed through its dashboard, academic record form, academic records report, streams page, parent/guardian report, and GPA validation workflow. The configured screens provide a structured way to enter and review admission information, while the enabled GPA workflow is intended to improve data accuracy before submission. Thus, the practical demonstrates how Zoho Creator forms, reports, dashboards, and workflows can support more organized and reliable admission-data management. Actual performance gains should be confirmed through testing with representative records.
