Reports, Dashboards, and UI Builder

1. AIM

To understand and implement Reports, Dashboards, and UI Builder for organizing data, generating meaningful reports, visualizing key performance indicators (KPIs), and designing user-friendly interfaces for effective monitoring and decision-making.

2. Problem Statement

Organizations generate large amounts of data from various business operations. Analyzing this data manually is time-consuming, error-prone, and inefficient. Without proper reporting and visualization tools, it becomes difficult to monitor performance, identify trends, and make informed decisions.

The Reports, Dashboards, and UI Builder use case provides a structured solution to collect and present information through customized reports, interactive dashboards, and user-friendly interfaces. It helps users access relevant information quickly, track performance, and improve operational efficiency.

3. Scope of the Use Case

The scope of this use case includes the following functionalities:

- Report Generation: Create reports using available data, filters, and selected fields.
- Data Analysis: Analyze business information to identify patterns, trends, and performance metrics.
- Dashboard Creation: Display important information through charts, graphs, tables, and KPI indicators.
- UI Customization: Design user interfaces by arranging components according to user requirements.
- Data Filtering: Filter information based on dates, categories, departments, or other criteria.
- User Access Management: Provide appropriate access to reports and dashboards based on user roles.
- Export and Sharing: Export reports into supported formats and share relevant information with authorized users.
- Decision Support: Help management and other stakeholders make informed decisions using visualized data.

4. Reports Used Overview

Reports are used to present organized information in a structured format. They help users review operational performance, compare results, and identify areas that require improvement.

The major types of reports used in this use case are:

S. No.	Report Type	Purpose
1	Summary Report	Provides a brief overview of important information.
2	Detailed Report	Presents complete records with relevant attributes.
3	Analytical Report	Helps identify trends, patterns, and relationships.
4	Performance Report	Measures performance using KPIs and targets.
5	Exception Report	Highlights errors, unusual values, or activities requiring attention.
6	Scheduled Report	Generates and delivers reports at predefined intervals.

5. Detailed Report Descriptions

5.1 Summary Report

A Summary Report presents key information in a concise and understandable format. It provides an overview of the overall status of business activities without displaying every individual record.

Key features:

- Displays total counts and aggregated values.
- Highlights important metrics.
- Provides a quick overview for management.
- Supports faster decision-making.

Example: A monthly summary report displaying total sales, completed orders, pending orders, and revenue.

5.2 Detailed Report

A Detailed Report provides comprehensive information about individual records. Users can examine specific transactions, activities, or entities for further analysis.

Key features:

- Displays complete record-level information.
- Supports sorting and filtering.
- Enables users to investigate specific records.
- Improves transparency and accuracy.

Example: A detailed employee report containing employee ID, name, department, attendance, and performance information.

5.3 Analytical Report

An Analytical Report examines data to identify trends, patterns, comparisons, and relationships. It helps users understand changes over time and evaluate possible improvements.

Key features:

- Compares data across different periods.
- Identifies trends and patterns.
- Supports graphical representations.
- Helps evaluate business performance.

Example: A quarterly sales analysis comparing revenue across different regions.

5.4 Performance Report

A Performance Report measures progress toward organizational goals using Key Performance Indicators (KPIs).

Key features:

- Displays actual performance against targets.
- Tracks productivity and efficiency.
- Identifies performance gaps.
- Supports performance evaluation.

Example: A performance report showing monthly targets, actual sales, target achievement percentage, and employee productivity.

5.5 Exception Report

An Exception Report identifies unusual conditions, failed processes, errors, or activities that require immediate attention.

Key features:

- Highlights abnormal values.
- Identifies incomplete or failed transactions.
- Supports corrective action.
- Helps reduce operational risks.

Example: A report identifying overdue payments, failed transactions, or orders that have exceeded their delivery deadlines.

5.6 Scheduled Report

A Scheduled Report is generated automatically at predefined times, reducing the need for manual report creation.

Key features:

- Supports daily, weekly, or monthly reporting.
- Reduces repetitive manual work.
- Provides information at regular intervals.
- Can support automatic distribution where configured.

Example: A weekly performance report automatically delivered to department managers.

6. Configuration and Workflow

This section explains how reports, dashboards, and user interfaces can be configured and used in a typical business application.

6.1 Configuration

Step 1: Identify Requirements

Determine the purpose of the report or dashboard, the intended users, and the information they need.

Step 2: Select the Data Source

Choose the appropriate database, dataset, or application module containing the required information.

Step 3: Configure Reports

Select the fields, filters, grouping, sorting, and calculations required to generate meaningful reports.

Step 4: Design Dashboards

Add suitable components such as charts, tables, KPI cards, and graphs. Arrange them to make important information easy to understand.

Step 5: Build the User Interface

Use the UI Builder to arrange interface elements, configure input fields, add navigation, and customize the layout for different users.

Step 6: Configure Access Permissions

Assign suitable permissions to users so that they can access only the reports, dashboards, and functions authorized for their roles.

Step 7: Test and Validate

Verify data accuracy, report calculations, dashboard visualizations, interface functionality, and access permissions before deployment.

6.2 Workflow

1. Identify Requirements

2. Connect Data Sources

3. Configure Reports

4. Create Dashboards

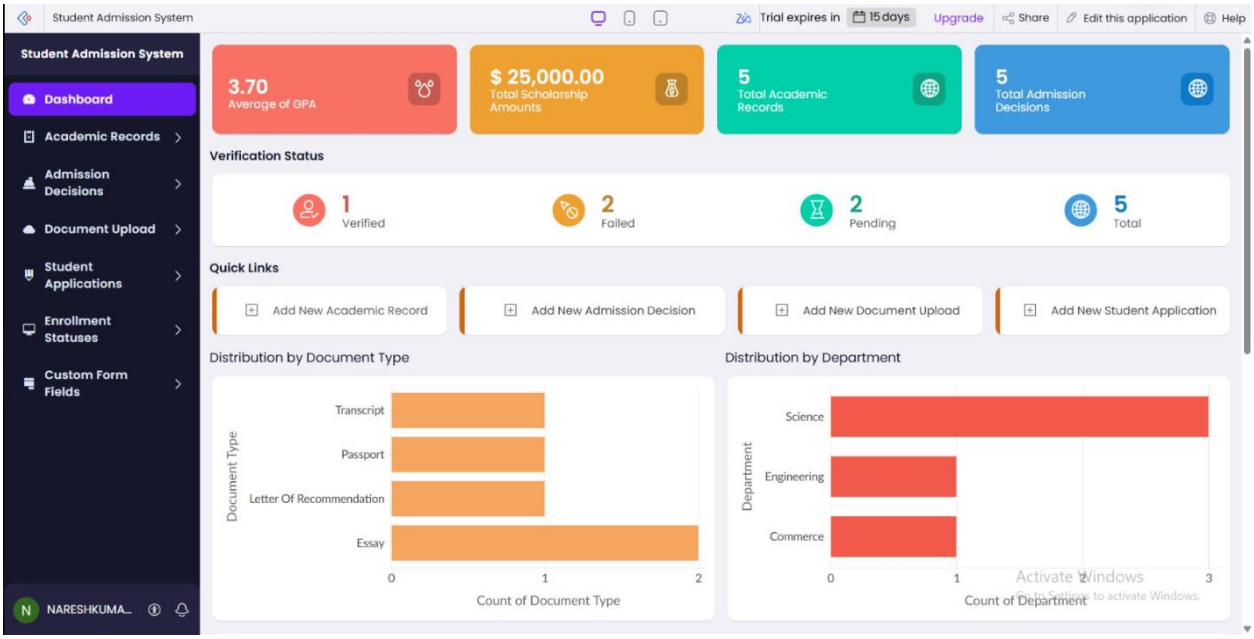

5. Design UI Using UI Builder

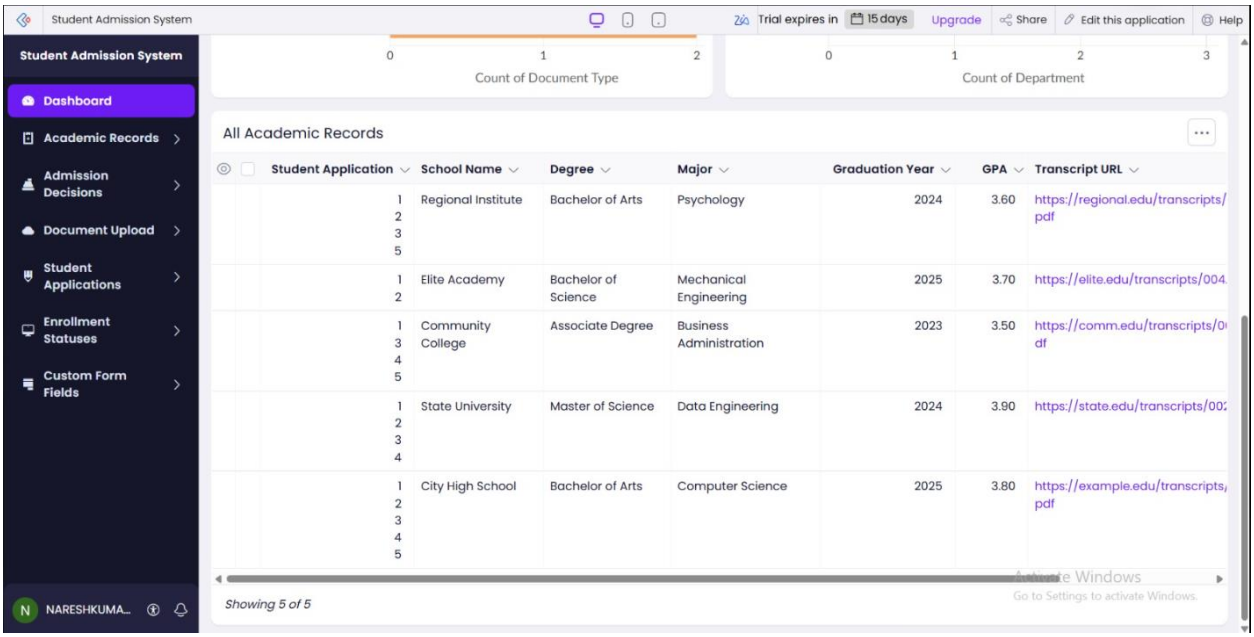

6. Test and Validate

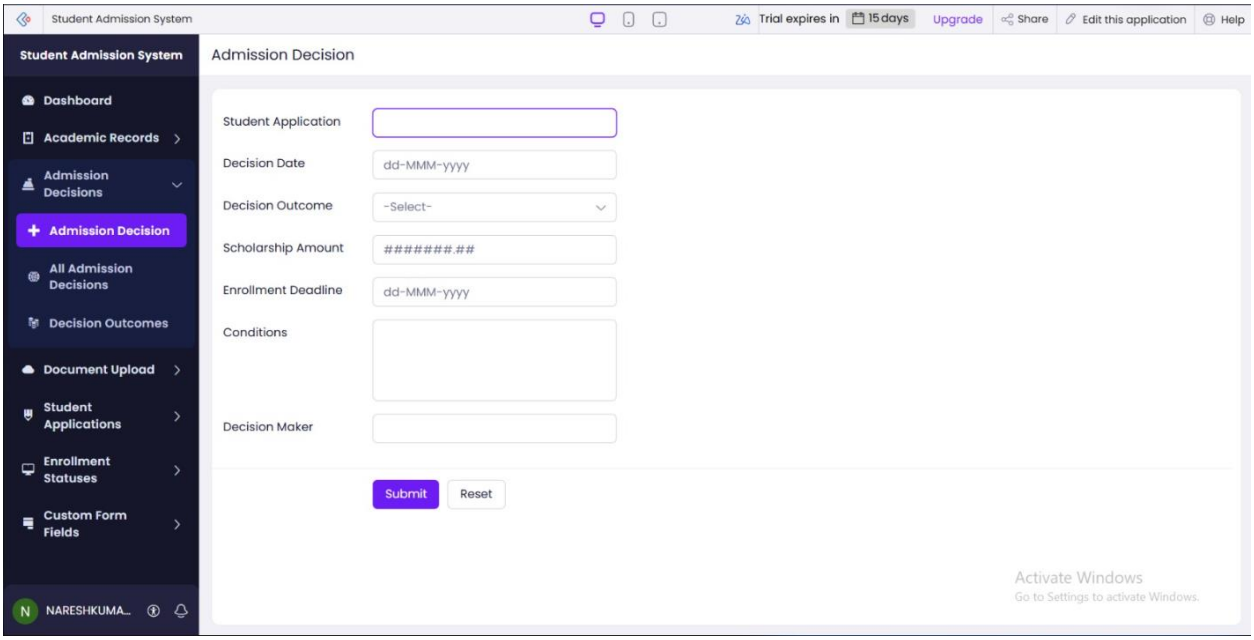

7. Publish and Monitor

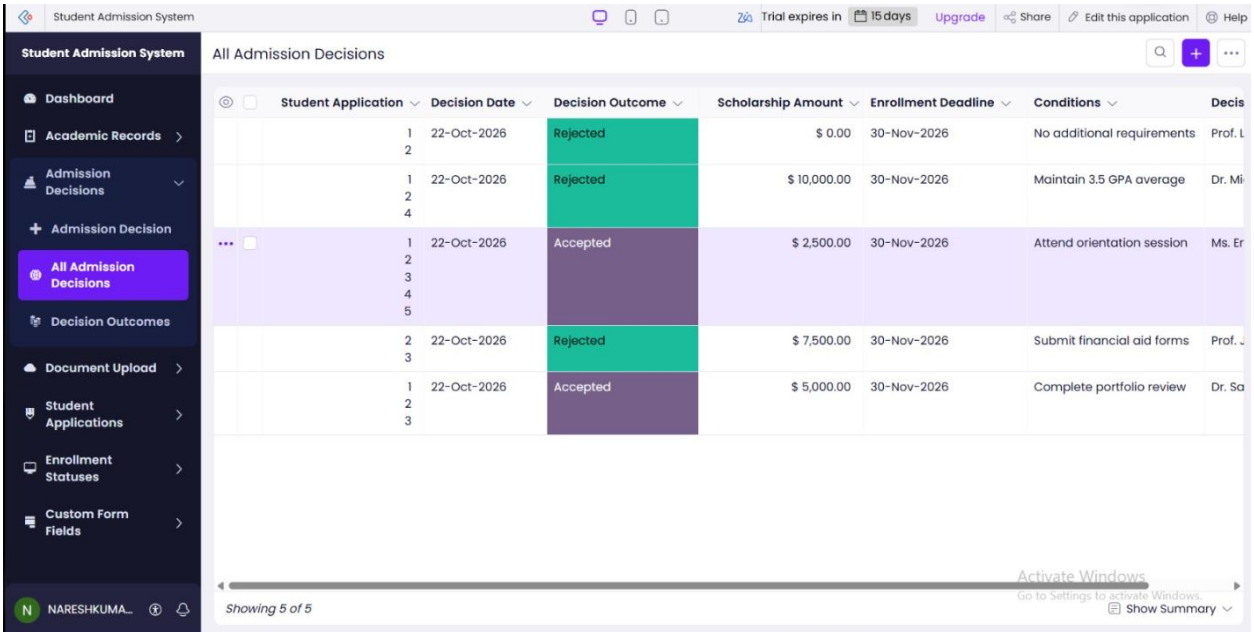

6.3 Expected Outcome

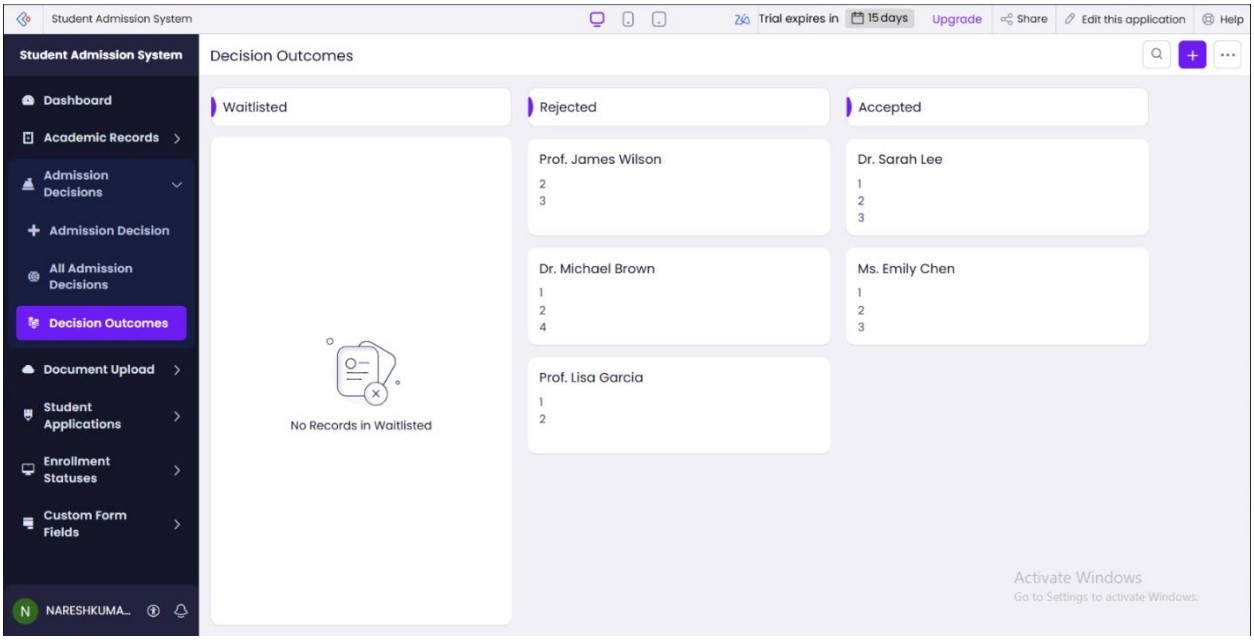

The implementation of Reports, Dashboards, and UI Builder provides a centralized way to access business information, monitor important performance indicators, and generate customized reports. It reduces manual effort, improves data visibility, supports better decision-making, and provides a user-friendly interface for different categories of users.
