APPLICATION DEPLOYMENT AND MIGRATION

A practical report based on the Student Admission Deployment Migration application

1. AIM

To design and demonstrate an application that manages environment setup, migration batches, deployment versions, admission applications, and server configurations. The application aims to organize deployment activities, monitor migration progress, and provide a clear view of server configuration and operational status.

2. OVERVIEW

The Student Admission Deployment Migration application centralizes deployment and migration-related information in one interface. Its dashboard summarizes total records, environment setups, migration batches, versions, and synchronization status. Separate modules are provided for Environment Setups, Migration Batches, Versions, Admission Applications, and Server Config. These modules help users maintain configuration details, track batch status, review server settings, and manage deployment records.

The interface includes visual summaries such as batch status and server-location distribution. Form workflows are configured to generate a reference code, validate an admission application submission, and notify an administrator after successful submission or approval-related events.

3. PROCEDURE

Step 1 – Open the dashboard: Review the summary cards for total records, environment setups, migration batches, and versions. Check the synchronization panel and charts.

Step 2 – Manage environment setups: Open Environment Setups and review the environment name, setup type, configuration data, setup date, person responsible, target server, and related batch/version information.

Step 3 – Review setup types: Open Setup Types to view Initial, Upgrade, and Relocation categories and inspect the environments associated with each category.

Step 4 – Review server configuration: Open Server Config Report to inspect configuration names, server names, hosting locations, IP addresses, port numbers, SSL status, last synchronization time, and deployment-version information.

Step 5 – Check server statuses: Open Statuses to view server components grouped under Active, Inactive, and Maintenance categories.

Step 6 – Configure form workflows: Open Workflow and review the Admission Application workflows: automatic reference-code generation, validation on form submission, and administrator notification after successful submission.

Step 7 – Verify the application: Return to the relevant modules and verify that records, configuration details, status summaries, and workflows are displayed as expected.

4. SCREENSHOTS

The following screenshots document the main screens and workflow configuration used in the application.

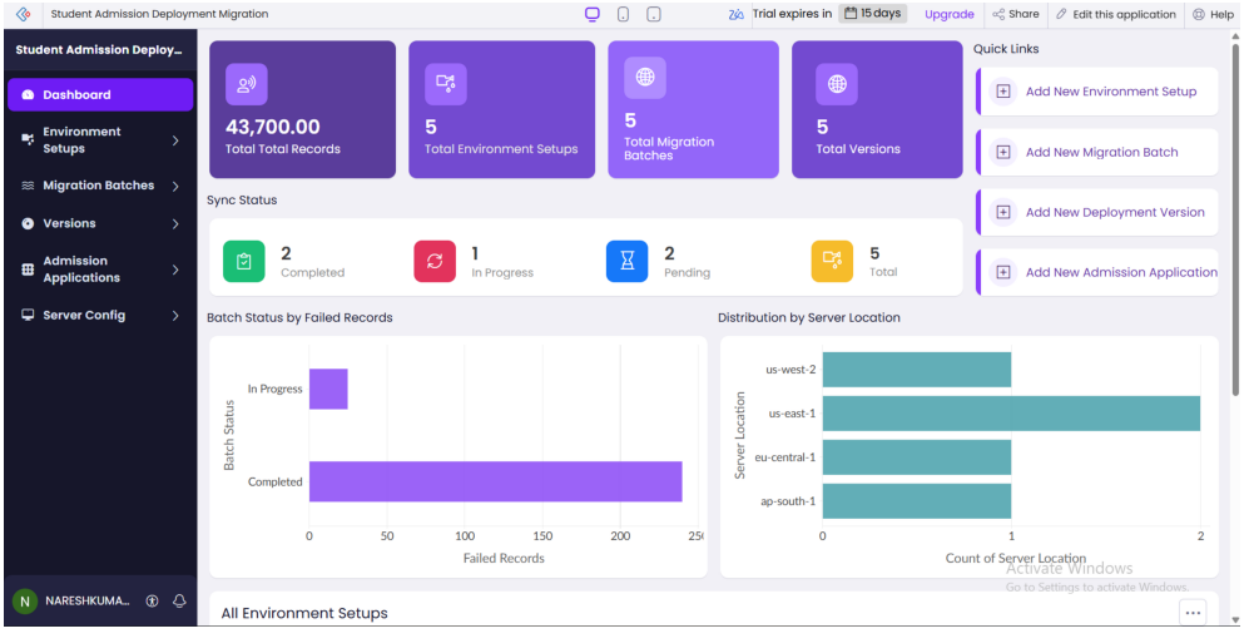

Figure 1. Dashboard showing record totals, environment setups, migration batches, versions, synchronization status, and summary charts.

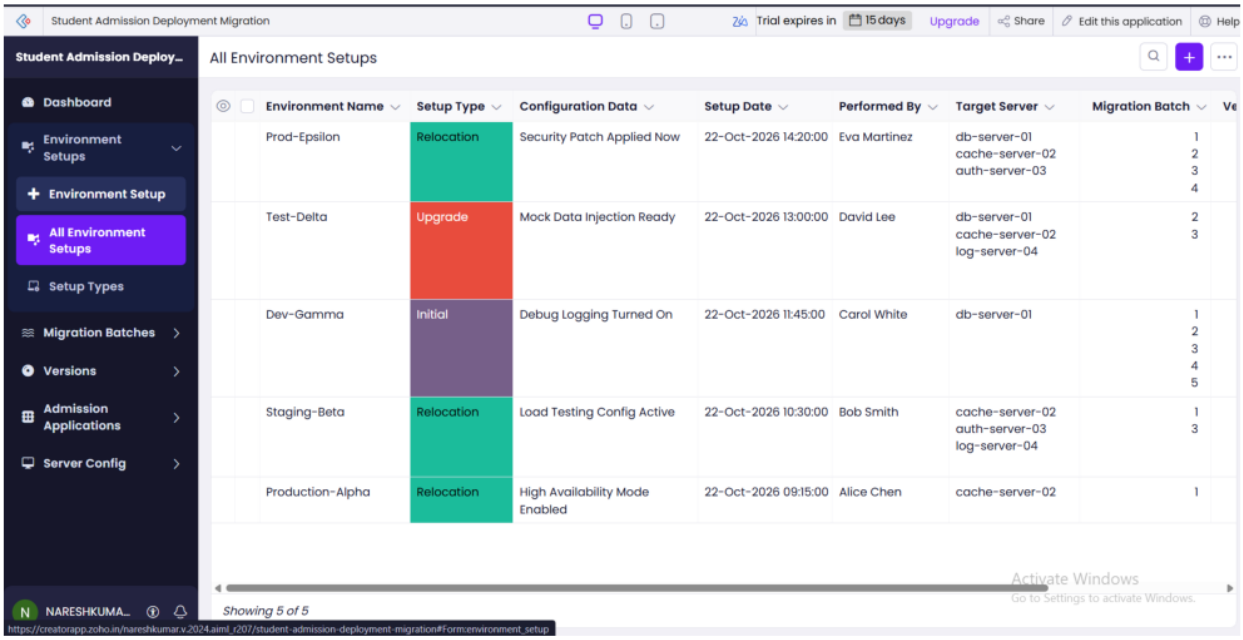

Figure 2. All Environment Setups page showing environment records and configuration details.

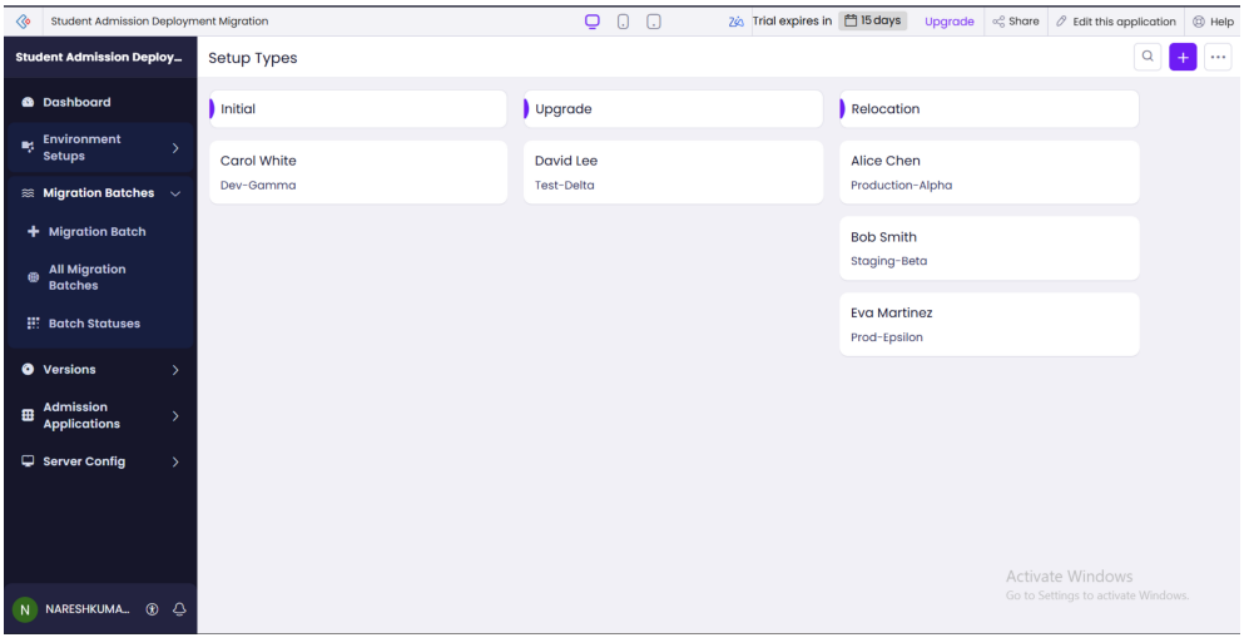

Figure 3. Setup Types page showing Initial, Upgrade, and Relocation categories with associated environments.

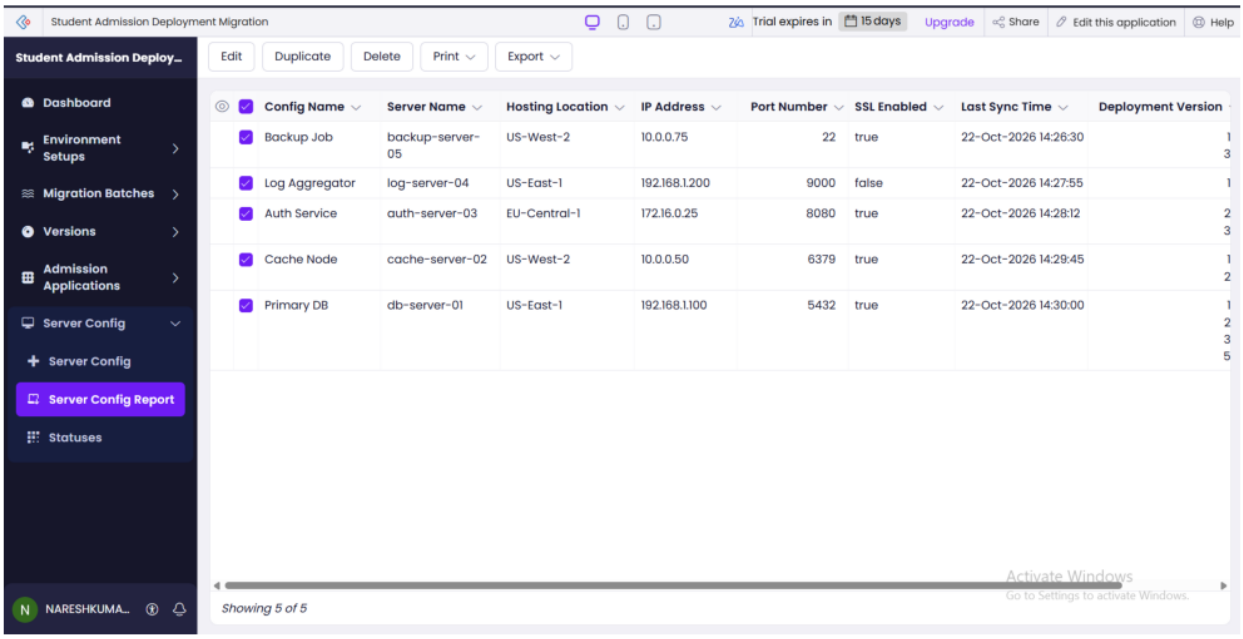

Figure 4. Server Config Report showing server names, locations, IP addresses, ports, SSL settings, and last sync times.

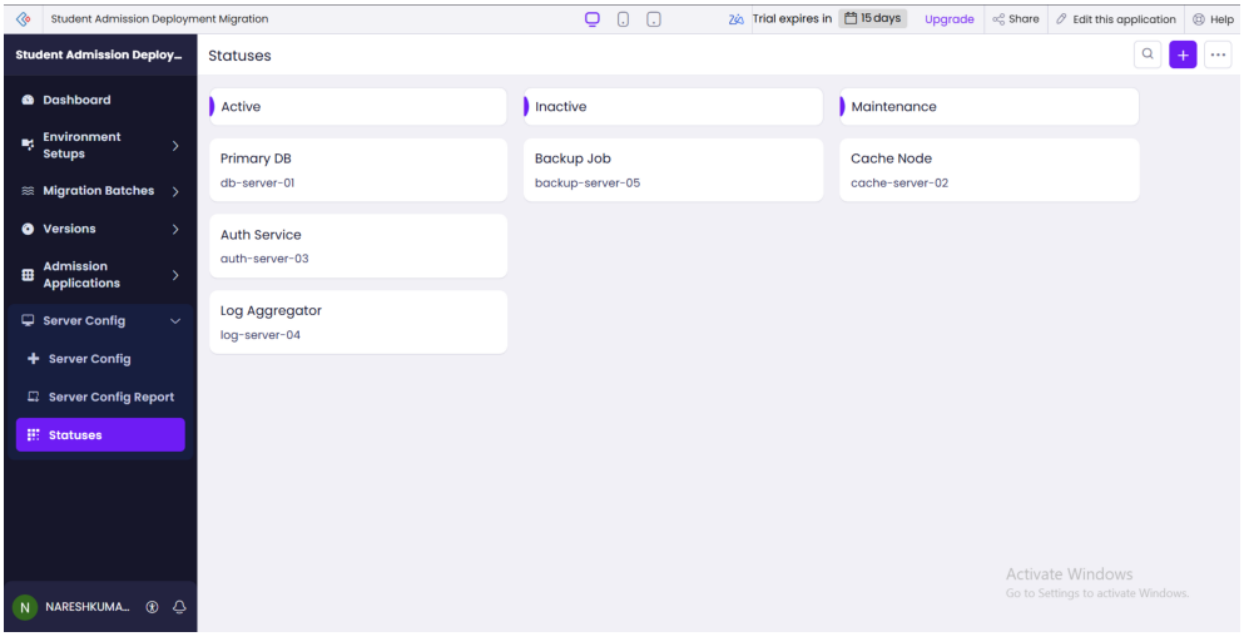

Figure 5. Statuses page showing server components grouped by Active, Inactive, and Maintenance.

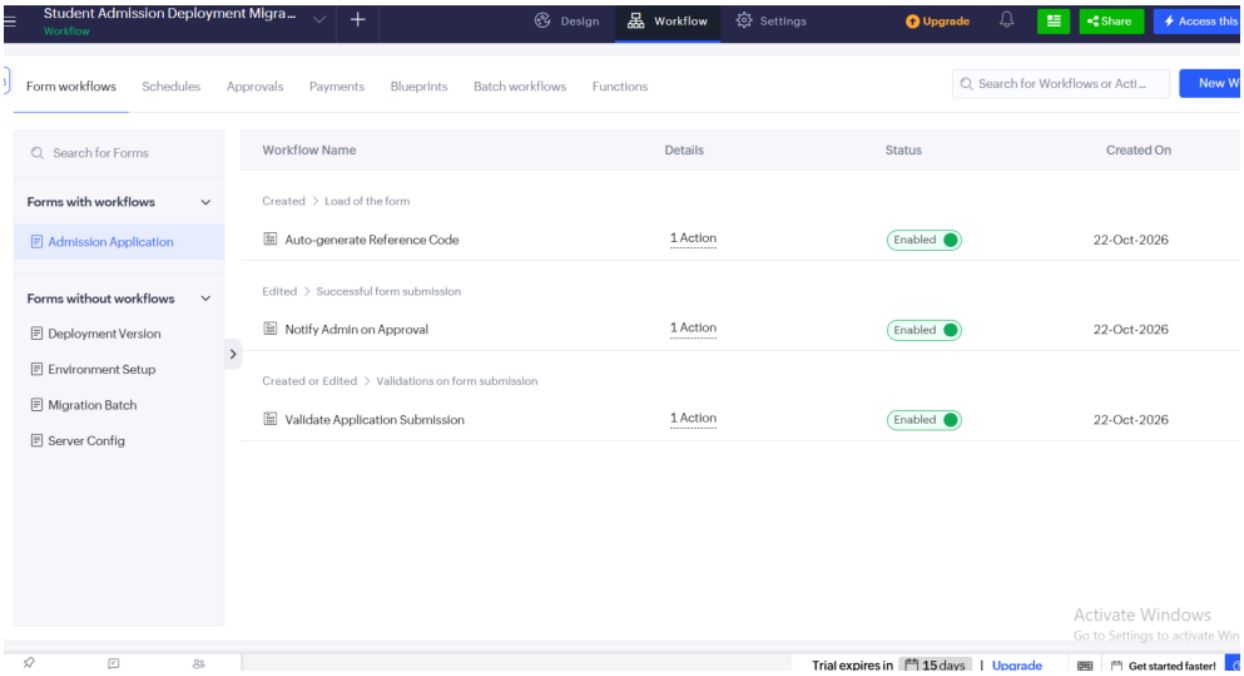

Figure 6. Workflow page showing admission application workflows for reference-code generation, submission validation, and administrator notification.

5. RESULT

The Student Admission Deployment Migration application was demonstrated through its dashboard, environment setup records, setup-type view, server configuration report, status summary, and form workflow configuration. The application provides a centralized interface for reviewing deployment and migration information, monitoring server-related details, and organizing admission-application submission workflows. Thus, the aim of managing deployment and migration activities through a structured application interface was achieved.
